Abstract

Students in UCSI University have been missing classes during the beginning of every semester due to the time table changes and the students are not notified. All these are because the students are not notified about the changes of timetable and location of the classrooms. Problems occurred not only because of time table changes during the beginning of the semester, it is also caused by sudden cancellation of class by the lecturers. There is no other way to tell the students except for posting the cancelation notice outside of the classroom and this will result the students going to college for nothing.

The purpose of this research paper is to suggest and implement an E-notification system to UCSI University with features and functionalities required by students to increase student satisfaction and deliver excellence in administrations and online notification. An evaluation is carried out to gather students' point of view, problems encountered from the current notifications of UCSI University. The methodologies used in this report are documents reviews and questionnaire. To achieve the aim of this research, a prototype application is developed to fulfill the requirements of the students.
