ABSTRACT

Nowadays people are trying to perform tasks in the shortest possible time with the least possible effort. In another word, they are trying to be complete the task in the most efficient ways as possible. This will enable them to be multitasking in order to succeed in ever competitive world. 7,

In order to do so, a better and efficient communication system needs to be created. Thanks to current information technology, the communication systems available through out the world has improved tremendously at a revolutionary rate.

Traditionally, an individual has to physically be present in the library in order to search, borrow or make reservation of a book. It can be a very time consuming to perform such task. Anger and frustration will arise if the book is not available.

The application of virtual library using the internet has greatly reduced the time and effort spend to perform these tasks to a certain extent. But the notion of time saving and better access given by mobile devices such as mobile phone and PDAs will further enhance the efficiency of performing such tasks. Hence, the system for this project is designed to give better accessibility to any user, anywhere and at any given time.
