## ABSTRACT

This project focuses on the development of a Wireless Movie Ticketing System. It is developed to offer a service to mobile users who can make book movie tickets via the mobile phone. It is to create an interconnected support infrastructure that will enable booking anytime, anywhere, over any network, using any appliance or wireless device. This wireless system has to fulfill a series of requirements. Of paramount importance are a broad acceptance by cinemas and a wide adoption by consumers. The report intends to provide a detail explanation of this project. There are classified into chapters for the development process and information needed for building up the project.
