Chapter 1

Abstract

Mobile technology is one of the killer applications in the information society today. Along the last years, many mobile application systems have been developed, targeted to specific sceneries and execution environments. . Delivering less, not more, is a new approach for IT but could be a critical success factor for mobile application development. This project demonstrates a mobile application which includes a distributed application. The main purpose of this project is to provide college students with their final exam grade, in particular modules, in the form of a message on their mobile. The idea of this project was generated from the actual results marking and publishing system of University College Sedaya International. This paper constitutes of the analysis report of this system, which has for title Marks on Mobile. It will include a literature review of the old system, the functional specification of the new system which includes use case diagrams, class diagram, operation specification, domain description and a full description of all user items.
