Abstract

For decades, surveys were carried out using paper based questionnaires that were distributed and collected for analysis by the surveyor. This technique used to be efficient in those years when technology wasn't so rampant. Nowadays, our lives have changed course and everything we do revolves around Information Technology.

This project applies the use of the newest invention in the field of Information Technology that is the wireless computing to come up with a questionnaire that can be uploaded in the student's mobile device and sent to the back end server.

This survey technique will get rid of the problems faced by the traditional questionnaires and will enhance the response rate of a survey. Above all, the student can get the results of the survey instantaneously.
