ABSTRACT

The reason of designing and implementing such a system was to open a world of information and entertainment in education. I have tried my best to do so with "Computer Based Training (CBT) Software".

Computer Based Training (CBT) Software is my own software that train students with the use of computers and its technology. It teaches the students how to interact with the computer. It also gives lectures on specific subjects in which the student learns about the subject. It allows students to learn on their own with their own pace. They can also master the materials given to them.

Computer Based Training (CBT) is a method to train the students in a newly manner with new technology of rich multimedia, text, animation, video, sound, quiz, games and much more, so that the students can learn on there own, with cost effective solutions and with better understandings of the tutorials and the lectures provided.

The student can log in and start studying the materials provided with rich multimedia technology. They can also view the real time videos provided and audio definitions. After the students have thoroughly studied the materials, they can go for quiz and the results will show them how much they have studied. This way they can learn more easily and quickly.

I hope that the students find my system useful enough to get the information, entertainment and education as they always wanted from Computers and its technology.
