## Abstract

This project is going to discuss about synchronization on Windows Mobile devices. A brand new application will be developed for the synchronization between Personal Computer and Windows Mobile devices. Once the synchronization process is built, a managing of SMS such as save, delete, write, and regroup SMS with PC will be enabled. After that, resynchronize the PC and Windows Mobile devices to transfer edited SMS to Windows Mobile devices. However, the SMS sending process will still depend on the mobile GSM network. Kindly go through the project report to gain understanding about the application design, developing, testing, and evaluation.
